# 1 Algorithms

## 1.1 Geometry

### 1.1.1 Convex Hull

**Time:**  $\mathcal{O}(n \log n)$

**Space:**  $\mathcal{O}(n)$

```
struct ConvexHull {
    using point = pair<double, double>;

    // The three points are a counter-clockwise turn if
    // cross > 0, clockwise if cross < 0, and collinear
    // if cross = 0.
    double cross(point a, point b, point c) {
        return (b.fi - a.fi) * (c.se - a.se) - \
            (b.se - a.se) * (c.fi - a.fi);
    }

    vector<int> run(const vector<point> &v) {
        int k = 0;
        vector<int> ans(v.size() * 2);

        sort(all(v), [](const point &a, const point &b) {
            return (a.fi == b.fi) ? (a.se < b.se) : (a.fi < b.fi);
        });

        // Uppermost part of convex hull
        for (int i = 0; i < v.size(); ++i) {
            while (k >= 2 && cross(v[ans[k-2]], v[ans[k-1]], v[i]) < 0)
                k--;
            ans[k++] = i;
        }

        // Lowermost part of convex hull
        for (int i = v.size() - 2, t = k + 1; i >= 0; --i) {
            while (k >= t && cross(v[ans[k-2]], v[ans[k-1]], v[i]) < 0)
                k--;
            ans[k++] = i;
        }

        ans.resize(k - 1);
        return ans;
    }
};
```

### 1.1.2 Geometry Functions

```
#define to_deg(x) ((x * 180.0) / M_PI)
#define to_rad(x) ((x * M_PI) / 180.0)
```

```
template <typename T>

            low[x] = min(low[x], L[i]);
    }
}

void run() {
    for (int i = 0; i < N; ++i)
        if (!vis[i])
            dfs(i);

    sort(all(arti));
    arti.erase(unique(all(arti)), arti.end());
}
};

```

## 1.2.2 Bellman-Ford

**Time:**  $\mathcal{O}(V \times E)$   
**Space:**  $\mathcal{O}(V + E)$

```

struct BellmanFord {
    struct Edge { int u, v, w; };

    int N;
    vector<int> dist;
    vector<Edge> graph;

    BellmanFord(int N) :

```

```

    N(N), dist(N)
    { init(); }

    void init() {
        fill(all(dist), inf);
    }

    void add_edge(int u, int v, int w) {
        graph.pb({ u, v, w });
    }

    int run(int s, int d) {
        dist[s] = 0;

        for (int i = 0; i < N; ++i)
            for (auto e : graph)
                if (dist[e.u] != inf &&
                    dist[e.u] + e.w < dist[e.v])
                    dist[e.v] = dist[e.u] + e.w;

        // Check for negative cycles, return -inf if
        // there is one
        for (auto e : graph)
            if (dist[e.u] != inf &&
                dist[e.u] + e.w < dist[e.v])
                return -inf;

        return dist[d];
    }
};

```

## 1.2.3 Bipartite Matching

**Time:**  $\mathcal{O}(V \times E)$   
**Space:**  $\mathcal{O}(V \times E)$

```

vector<int> graph[MAX];

struct BipartiteMatching {
    int N;
    vector<int> vis, match;

    BipartiteMatching(int N) :
        N(N), vis(N), match(N) {}

    void init() {
        fill(all(vis), 0);
        fill(all(match), -1);
    }

    int dfs(int x) {
        if (vis[x])
            return 0;

        vis[x] = 1;
        for (auto i : graph[x])
            if (match[i] == -1 || dfs(match[i])) {
                match[i] = x;
                return 1;
            }

        return 0;
    }
}

```

```

int run() {
    int ans = 0;
    for (int i = 0; i < N; ++i)
        ans += dfs(i);

    return ans;
}
};

```

## 1.2.4 Centroid Decomposition

### Description:

The Centroid Decomposition of a tree is a tree where: 1) its root is the centroid of the original tree, and 2) its children are the centroid of each tree resulting from the removal of the root from the original tree.

The result is a tree with  $\log n$  height, where the path from  $a$  to  $b$ , in the original tree, can be decomposed into the path from  $a$  to  $\text{lca}(a, b)$  and from  $\text{lca}(a, b)$  to  $b$ .

This is useful because each one of the  $n^2$  paths of the original tree is a concatenation of two paths in a set of  $\mathcal{O}(n \log n)$  paths (from each node to all of its ancestors in the centroid decomposition).

**Time:**  $\mathcal{O}(V \log V)$   
**Space:**  $\mathcal{O}(V + E)$

```

// Must be a tree
vector<int> graph[MAX];

struct CentroidDecomposition {
    vector<int> par, size, marked;

    CentroidDecomposition(int N) :
        par(N), size(N), marked(N)
    { init(); }

    void init() {
        fill(all(marked), 0);
        build(0); // 0-indexed vertices
    }

    void build(int x, int p = -1) {
        int n = dfs(x);
        int centroid = get_centroid(x, n);

        marked[centroid] = 1;
        par[centroid] = p;

        for (auto i : graph[centroid])
            if (!marked[i])
                build(i, centroid);
    }

    // Calculates size of every subtree.
    int dfs(int x, int p = -1) {
        size[x] = 1;
        for (auto i : graph[x])
            if (i != p && !marked[i])
                size[x] += dfs(i, x);
        return size[x];
    }
}

```

```

}

int get_centroid(int x, int n, int p = -1) {
    for (auto i : graph[x])
        if (i != p && size[i] > n / 2 && !marked[i])
            return get_centroid(i, x, n);
    return x;
}

int operator[](int i) {
    return par[i];
}
};

```

## 1.2.5 Dijkstra

### Description:

Dijkstra's algorithm for finding the shortest paths between nodes in a graph. It works by greedily extending the shortest path at each step.

Doesn't work with negative-weighted edges, for that, Bellman-Ford algorithm must be used.

**Time:**  $\mathcal{O}(E + V \log V)$

**Space:**  $\mathcal{O}(V + E)$

```

vector<int> graph[MAX];

struct Dijkstra {
    int N;
    vector<int> dist, vis;

    Dijkstra(int N) :
        N(N), dist(N), vis(N)
    { init(); }

    void init() {
        fill(all(vis), 0);
        fill(all(dist), inf);
    }

    int run(int s, int d) {
        set<ii> pq;

        dist[s] = 0;
        pq.insert(ii(0, s));

        while (pq.size() != 0) {
            int u = pq.begin()->se;
            pq.erase(pq.begin());

            if (vis[u]) continue;
            vis[u] = 1;

            for (auto i : graph[u]) {
                if (!vis[i.fi] && dist[i.fi] > dist[u] + i.se) {
                    dist[i.fi] = dist[u] + i.se;
                    pq.insert(ii(dist[i.fi], i.fi));
                }
            }
        }
    }
};

```

```

    return dist[d];
}
};

```

## 1.2.6 Dinic's

**Time:**  $\mathcal{O}(E \times V^2)$

**Space:**  $\mathcal{O}(V + E)$

```

struct Dinic {
    struct Edge { int u, f, c, r; };

    int N;

        return size;
    }
};

```

### 1.2.13 Lowest Common Ancestor (LCA)

**Description:**

The LCA between two nodes in a tree is a node that is an ancestor to both nodes with the lowest height possible.

The algorithm works by following the path up the tree from both nodes "simultaneously" until a common node is found. The naive approach for that would be  $\mathcal{O}(n)$  in the worst case. To improve that, this implementation uses "binary lifting" which is a way of figuring out the right number of up-moves needed to find the LCA by following the binary representation of the distance to the destination (similar to the "binary search by jumping"), but, for that, a preprocessing must be done to set every parent at a  $2^i$  distance.

**Time:**

- preprocess:  $\mathcal{O}(V \log V)$
- query:  $\mathcal{O}(\log V)$

**Space:**  $\mathcal{O}(V + E + V \log V)$

```
#define MAXLOG 20 //log2(MAX)
```

```
vector<ii> graph[MAX];
```

```

### 1.3.6 Gale-Shapley (Stable Marriage)

#### Description:

Two groups, each of size  $N$  are given: men and women. Each person has a list of preference ranking all  $N$  people of the opposite sex. The task is to unite both groups into stable pairs. A set of pairs is stable if there are no unassigned couple that like each other more than their assigned pair.

The algorithm's steps are: 1) allow every men to propose to their highest ranking woman; 2) the women become tentatively engaged to their top choice of men; 3) all rejected men propose to their next choice; 4) the woman replaces their current pair in case a man with a higher rank proposes to her, the replaced men are now marked as rejected; 5) repeat step 3 until all men are paired.

**Time:**  $\mathcal{O}(n^2)$

**Space:**  $\mathcal{O}(n^2)$

```

```

### 1.3.9 Linear Diophantine Equation

#### Description:

A Linear Diophantine Equation is an equation in the form  $ax + by = c$ . A solution of this equation is a pair  $(x, y)$  that satisfies the equation. The locus of (lattice) points whose coordinates  $x$  and  $y$  satisfy the equation is a straight line.

The equation has a solution only if  $\gcd(a, b) | c$ . In the case of existing a solution for the provided  $a, b, c$ , the infinite set of coordinates  $(x, y)$  can be obtained with  $\text{get}(t)$  for  $t = \dots, -2, -1, 0, 1, 2, \dots$

**Time:**  $\mathcal{O}(\log \min(a, b))$

**Space:**  $\mathcal{O}(1)$

```

### 1.3.10 Linear Recurrence

**Time:**  $\mathcal{O}(\log n)$

**Space:**  $\mathcal{O}(1)$

```
template <typename T>
matrix<T> solve(int x, int y, int n) {
    matrix<T> in(2, 2);
```

```
    // Example
    in[0][0] = x % MOD;
    in[0][1] = y % MOD;
    in[1][0] = 1;
    in[1][1] = 0;

    return fast_pow<T>(in, n);
}
```

### 1.3.11 Matrix

**Space:**  $\mathcal{O}(R \times C)$

```
template <typename T>
struct Matrix {
    int r, c;
    vector<vector<T>>> m;

    Matrix(int r, int c) : r(r), c(c) {
        m = vector<vector<T>>>(r, vector<T>(c, 0));
    }
```

```
    Matrix operator*(Matrix a) {
        assert(r == a.c && c == a.r);

        Matrix res(r, c);
        for (int i = 0; i < r; i++)
            for (int j = 0; j < c; j++) {
                res[i][j] = 0;

                for (int k = 0; k < c; k++)
                    res[i][j] += m[i][k] * a[k][j];
            }

        return res;
    }
```

```
    vector<T> &operator[](int i) {
        return m[i];
    }
};
```

### 1.3.12 Modular Multiplicative Inverse

**Time:**  $\mathcal{O}(\log m)$

**Space:**  $\mathcal{O}(1)$

```
// Fermat's Little Theorem: Used when m is prime
int fermat(int a, int m) {
    return bin_exp(a, m - 2);
}
```

```
// Extended Euclidean Algorithm: Used when m
// and a are coprime
int extended_euclidean(int a, int m) {
    int x, y;
    int g = ext_gcd(a, m, x, y);
    return (x % m + m) % m;
}
```

### 1.3.13 Sieve of Eratosthenes

**Time:**  $\mathcal{O}(n \times \log \log n)$

**Space:**  $\mathcal{O}(n)$

```
vector<int> sieve(int n) {
    vector<int> primes;
    vector<int> is_prime(n + 1, 1);

    for (int p = 2; p * p <= n; ++p)
        if (is_prime[p])
            for (int i = p * p; i <= n; i += p)
                is_prime[i] = false;

    for (int p = 2; p <= n; ++p)
        if (is_prime[p])
            primes.pb(p);

    return primes;
}
```

## 1.4 Paradigm

### 1.4.1 Edit Distance

**Time:**  $\mathcal{O}(m \times n)$

**Space:**  $\mathcal{O}(m \times n)$

```
int dp[MAX][MAX];

int edit_distance(string a, string b) {
    for (int i = 0; i <= a.size(); ++i)
        for (int j = 0; j <= b.size(); ++j)
            if (i == 0)
                dp[i][j] = j;
            else if (j == 0)
                dp[i][j] = i;
            else if (a[i-1] == b[j-1])
                dp[i][j] = dp[i-1][j-1];
            else
                dp[i][j] = 1 + min({dp[i][j-1],
                                   dp[i-1][j],
                                   dp[i-1][j-1]});

    return dp[a.size()][b.size()];
}
```

### 1.4.2 Kadane

**Time:**  $\mathcal{O}(n + m)$

**Space:**  $\mathcal{O}(n + m)$

```
int kadane(const vector<int> &v, int &start, int &end) {
    start = end = 0;
    int msf = -inf, meh = 0, s = 0;

    for (int i = 0; i < v.size(); ++i) {
        meh += v[i];

        if (msf < meh) {
            msf = meh;
            start = s, end = i;
        }

        if (meh < 0) {
            meh = 0;
            s = i + 1;
        }
    }

    return msf;
}
```

### 1.4.3 Longest Increasing Subsequence (LIS)

**Time:**  $\mathcal{O}(n^2)$

**Space:**  $\mathcal{O}(n)$

```
int lis(vector<int> v) {
    vector<int> lis(v.size()); lis[0] = 1;

    for (int i = 1; i < v.size(); ++i) {
        lis[i] = 1;

        for (int j = 0; j < i; ++j)
            if (v[i] > v[j] && lis[i] < lis[j] + 1)
                lis[i] = lis[j] + 1;
    }

    return *max_element(all(lis));
}
```

### 1.4.4 Longest Common Subsequence

**Time:**  $\mathcal{O}(n \times m)$

**Space:**  $\mathcal{O}(n \times m)$

```
int dp[MAX][MAX];

string lcs(string a, string b) {
    for (int i = 0; i <= a.size(); ++i) {
        for (int j = 0; j <= b.size(); ++j) {

        return op(ra, rb);
    }
};
```

### 1.6.9 Sqrt Decomposition

- Time:
- preprocess:  $\mathcal{O}(n)$
  - query:  $\mathcal{O}(\sqrt{n})$
  - update:  $\mathcal{O}(1)$

Space:  $\mathcal{O}(n)$

```
struct SqrtDecomposition {
    int block_size;
    vector<int> v, block;

    SqrtDecomposition(vector<int> v) :
        v(v), block(v.size())
    { init(); }

    void init() {
        preprocess(v.size());
    }

    void update(int idx, int val) {
        block[idx / block_size] += val - v[idx];
        v[idx] = val;
    }

    int query(int l, int r) {
        int ans = 0;

        for (; l < r && ((l % block_size) != 0); ++l)
            ans += v[l];

        for (; l + block_size <= r; l += block_size)
            ans += block[l / block_size];

        for (; l <= r; ++l)
            ans += v[l];

        return ans;
    }
};
```

```
void preprocess(int n) {
    block_size = sqrt(n);

    int idx = -1;
    for (int i = 0; i < n; ++i) {
        if (i % block_size == 0)
            block[++idx] = 0;

        block[idx] += v[i];
    }
};
```

### 1.6.10 Trie

- Time:
- insert:  $\mathcal{O}(M)$
  - search:  $\mathcal{O}(M)$

Space:  $\mathcal{O}(\text{alph} \times N)$

```
template <typename T>
struct Trie {
    int states;

    vector<int> ending;
    vector<vector<int>> trie;

    // Number of words (N) and number of letters per word
    // (M), and number of letters in alphabet (alph).
    Trie(int N, int M, int alph) :
        ending(N * M),
        trie(N * M, vector<int>(alph))
    { init(); }

    void init() {
        states = 0;
    }
};
```

```
for (auto &i : trie)
    fill(all(i), -1);

int len(T x) {
    if constexpr(is_same_v<T,int>)
        return 32;
    return x.size();
}

int idx(T x) {
    if constexpr(is_same_v<T,int>)
        return !(x & (1 << i));
    return x[i] - 'a';
}

void insert(T x) {
    int node = 0;

    for (int i = 0; i < len(x); ++i) {
        if (trie[node][idx(x, i)] == -1)
            trie[node][idx(x, i)] = ++states;
        node = trie[node][idx(x, i)];
    }

    ending[node] = true;
}

bool search(T x) {
    int node = 0;

    for (int i = 0; i < len(x); ++i) {
        node = trie[node][idx(x, i)];
        if (node == -1)
            return false;
    }

    return ending[node];
};
```

## 2 Misc

### 2.1 Environment

#### 2.1.1 Vim Config

```
" Tabs
set expandtab
set smarttab

" Indents
set shiftwidth=2
set tabstop=2
set autoindent
set smartindent
```

```
set cindent

" Turn backup off
set nobackup
set nowb
set noswapfile

" Highlight matching brackets
set showmatch

" Display line numbers
set number
```

#### 2.1.2 Template

```
#define EPS 1e-6
#define MOD 1000000007
#define inf 0x3f3f3f3f
#define llinf 0x3f3f3f3f3f3f3f3f

#define fi first
#define se second
#define pb push_back
#define ende '\n'

#define all(x) (x).begin(), (x).end()
```

```
#define rall(x) (x).rbegin(), (x).rend()
#define mset(x, y) memset(&x, (y), sizeof(x))
```

```
using namespace std;
```

```
using ll = long long;
using ii = pair<int,int>;
```

```
int main() {
    ios::sync_with_stdio(0);
```

```
    cin.tie(0);
```

```
    return 0;
```

```
}
```
